

Particle Accelerators –
Fusion of Science, Technology & Art
... but - *Do They Have Future?*

Vladimir D. Shiltsev

Fermi National Accelerator Laboratory
Accelerator Physics Center

PART I:

Complexity of Accelerators,

“CPT Theorem”

LHC Luminosity Outlook

Comparison of Particle Colliders

To reach higher and higher collision energies, scientists have built and proposed larger and larger machines.

Muon Collider
d=2km

LHC
d=8.4km

ILC
l=30km

CLIC
l=50km

VLHC
d=74km

Size, Cost and Complexity

SIZE ISN'T EVERYTHING

In particle physics, bigger colliders generally achieve higher-energy collisions — and have higher costs. But a muon collider could reach high energies with a small footprint, and relatively low costs. It would also be much less complex than proposed alternatives, according to Fermilab physicist Vladimir Shiltsev, who has estimated the number of major technological components in four of the five machines illustrated here.

2 km

TEVATRON

1985–present

Accelerates: Protons

What does the complexity cost us?

Tevatron Luminosity Growth *log-lin*

Luminosity doubles every 1050 stores (~1 year and 4 month)

e-growth time ~ 2 years

Peak luminosity, $1E30$

CDF&D0 Luminosity, 10^{30}

Tev Luminosity Improvements 2002-05

1. Optics AA->MI lines fixed	Dec'01	~25 %
2. New LB squeeze helix, TEL-1 abort	Mar'02	~40 %
3. "New-new" injection helix	May'02	~15 %
4. AA Shot lattice vs IBS	July'02	~40 %
5. Tev BLT/inst.dampers at injection	Sep'02	~10 %
6. Pbar coalescing improved in MI	Oct'02	~5 %
7. C0 Lambertsons Removed	Feb'03	~15 %
8. S6 cuircuit tuned/SEMs removed	June'03	~10 %
9. "5 star" helix on ramp	Aug'03	~2 %
10. Reshimming/Alignment	Nov'03	~12 %
11. Longer Stores/ MI dampers	Feb'04	~19 %
12. 2.5MHz AA → MI trnsf/Cool shots	April'04	~8 %
13. Reduction of beta* to 35 cm	May'04	~26 %
14. Shots from Recycler	July'04	~20% (?)
15. RR e-cooling operation	Jan-Jul'05	~25% (?)
16. Slip Stacking in MI	Mar'05	~20%
17. Tev Octupoles at 150 GeV	April'05	~5%
18. Reduction of beta* to 28 cm	Sep'05	~10 %

2006-09 improvements

19. Pbar production task force	Feb'06	~10 %
20. Tevatron 150 GeV helix → more p's	June'06	~10 %
21. Tev collision helix → lifetime	July'06	~15 %
22. New RR WP → emittances	Sep'06	~25 %
23. Fast AA → RR transfers (60 → 15min)	End'06	~15%
24. New Pbar target/higher gradient	Jan'07	~10%
25. Tevatron sextupoles for new WP	2007	~10(?)%
26. Tevatron optics $Q''=0$	2008	~5%?
27. Shot-setup time reduction/multi-p	2008-09	~5%?
28. Scraping protons in MI	2008-09	~3-4%?
29. Pbar emittance dilution/B0 aperture	2008-09	~2-4%?
30. MI Collim and Booster Correctors	2009	~3-5%?

Tevatron Experience - Lessons

#1: there was no "silver bullet" which would bring to the goal

#2: 30 steps resulted in ~36-fold increase in luminosity

#3: that makes on average ~12.5% increase per step

Gain after 8 steps $(1 + 0.125)^8 \approx e$

Gain after 16 steps $(1 + 0.125)^{16} \approx e^2$

Gain after N steps $(1 + 0.125)^N \approx e^{N/8}$

Luminosity: “ δ -Steps” Evolution

CPT Theorem for Accelerators

$$C \times P = T$$

C = Complexity

P = Performance

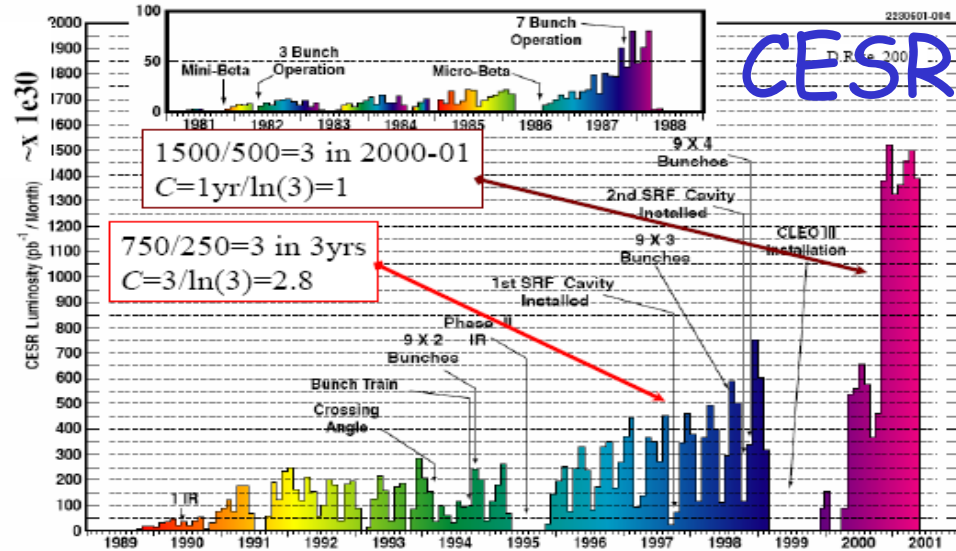

or Challenge = $\text{Ln}(Lumi)$

T = Time to reach P

$$L(\text{after time } T) = L_0 \times \exp(T / C)$$

CESR, SLC, LEP, PEP-II, KEK-B

ISR, SppS, HERA, RHIC

The Art of Commissioning

*It takes time to get to perfection...
~3-8 years for
today's colliders*

*Leonardo worked on
La Gioconda from
1503 to 1508... and
left it unfinished*

“Not Very Complex Machine”

Complexity of Beams

Complexity 0-0.5		APS, LCLS
Complexity 0.5-1		FNAL/MI
Complexity 1		B-factories
Complexity 1.5		HERA
Complexity 2		DCI/Orsay,80
Complexity 2		Tevatron,LHC
Complexity 2.5		B-B-Comps'n

Scenarios of LHC Luminosity ca'07

Three Points of Part I:

- **Accelerators are complex:**
 - "Complexity" depends on the type (# beams, type of particles) and size of the machine
 - Energy Frontier Colliders are the most complex
 - Small single beam accelerators are "simple", have numerous applications and built in dozens-to-hundreds
- **Don't hold your breath for very fast ramp of the LHC luminosity to design value (CPT theorem)**
- **Accelerators are really a conjunction of Technology, Art and Science:**
 - "state-of-the-art" magnet and/or RF technology
 - long battles for performance need "artistic" ingenuity
 - capitalized on many scientific breakthroughs.. more under study →

PART II:

Science of Accelerators

New Ideas, Crazy Ideas

New Paradigm for HEP

“Look Into Future” – 60 Years Ago

Major Advances since 1951:

- Strong Focusing
- Colliding Beams
- Super-conducting Magnets
- Super-conducting RF

“...Looking to the future, it is difficult to see how particles of energy greater than 10,000 MeV can be produced economically by existing methods. Further progress may have to await the introduction of new ideas.”

Ernest T.S. WALTON, Nobel Lecture, Dec. 11, 1951

Energy Frontier History

Is the field of accelerators dying?

Receipe

Situation looked similarly dim at any given moment, and the progress was due to:

- push existing technologies
- improve beam handling
- develop new ideas
- think “out of box” (drop some requirements)

Advancing Technology - Magnets

50T is 10x Tevatron and 5x LHC

Twisted 8 strand cable
reactor cable

Better Beam Handling - Repulsion

Space Charge Neutralization

Budker , 1956 Studies, tests → not stable!
→ let's immerse in magnetic field (e-column)

e-Column for FNAL Main Injector

Ionization electrons stay on magnetic field lines

Residual ions removed

The idea works well in
simulations → tests needed

Collect

Similar Device Works in Tevatron

Tevatron Electron Lens

~4 mm dia 2 m long very straight beam of ~10kV
~1A electrons ($\sim 10^{12}$) immersed in 3T solenoid

TEL helps bunches dying in collisions

**similar electron lens should
greatly help LHC when/if it will get
to design beam intensities**

17.4 hrs vs 10.0 hr time in collisions (min)

Hollow Electron Beam Collimator

**Collimator to control
particle loss without any
material (no matter)
- another “must have” for
LHC**

Example of Evolution: Music to Ears

LHC

(PRODUCT)™

Qualitative Advances

New Drivers/Power Sources:

- another beam
- laser

New Accelerating Media:

- plasma
- dielectrics
- microstructures
- crystals

Weird Schemes/Ideas

Wakefields In Dielectric Tube

Goal ~1GV/m (diamond surface limit)
 Achieved ~100 MV/m over ~1 m (AWA)
 Challenge - staging

D=5mm diamond tube

0.5mm wall → 34GHz

Monochromatic protons from laser jolt

IOQ
Jena

Titanium foil 5 μm
+ PMMA dots
20 x 20 x 0.2 μm

Goal $\sim 1\text{ GeV}$

Achieved $\sim 200\text{ MeV}$
with $dE/E < 3\%$

Challenge s

- get high charge
- small sizes
- higher laser power

Excitation of Plasma Waves

Idea- Tajima & Dawson, Phys. Rev. Lett. (1979)

Plasma wave: electron
density perturbation

Laser/beam pulse $\sim \lambda_p/c$

Option #1:

Short intense e-/e+/p bunch

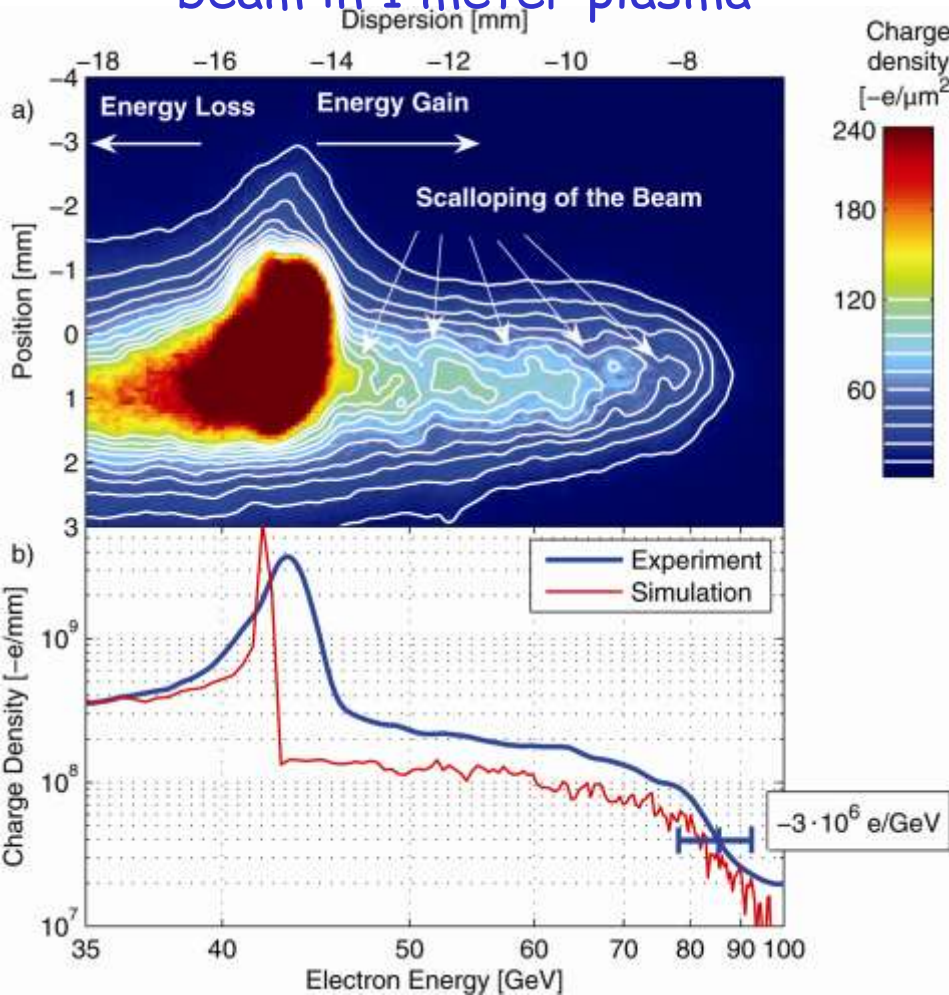

Option #2:

Short intense laser pulse

Beam Excites Plasma

- Acceleration gradients of $\sim 50 \text{ GV/m}$ ($3000 \times \text{SLAC}$)
 - Doubled energy of 45 GeV beam in 1 meter plasma

Challenges/Issues:

- small (dE/E , size) beam still to be achieved
- (FACET experiment at SLAC underway)
- needs unique drive beam
- defocuses positrons
- hard to preserve ultra small beam emittances
- thinking of using protons as a drive (even harder)

Laser Excites Plasma

■ Achieved ~ 30 GV/m (Berkeley)

- 1 GeV over 3 cm
- 40 TW laser

Challenges/Issues:

- speed of light in plasma always $< c$
- need many stages - hard
- BELLA experiment at LBNL with Petawatt laser (not table top!)
- low rep rate, efficiencies
- hard to preserve ultra small beams

SiC, diamond, metamaterials, etc

Metamaterials

Antipov (ANL)

Essence of the PASER (micro)

Travelling Laser Focus across Resonant Microstructures

Vladimir Shiltsev - Future of

BNL, April 5th, 2007

L. Schächter, Phys. Lett. A., **205**, p. 355-358(1995).

My Favorite “Theme” - Crystals

- Strong inter-planar electric fields $\sim 10\text{V/\AA}=1\text{GV/cm}$
- Very stable, can be used for
 - deflection/bending (*works*)
 - focusing (*works*)
 - acceleration (*if excited*)

T980 experiment at Tevatron

Crystal Excitation by X-Rays

Tajima, Cavenago, Phys. Rev. Lett. 59 (1987), 1440

FIG. 1. Bormann anomalous transmission. When the x rays are injected at the Bragg angle, the Bormann effect takes place. Particle beams are injected along the crystal axis.

- Need 40keV high peak power x-rays
 - now available from SASE FELs like LCLS
- Muons preferred
 - bremsstrahlung
- Gradients $> 1 \text{ GV/cm}$
- μ^+ rad length 10^9 cm
 - total energy $\sim 10^9 \text{ GeV}$

Even Better Way (...but – Fantastic)

Mössbauer Effect
recoil-free

"Reverse" Mössbauer Effect
full recoil

Progress Feeds Dreams

Plasma-Accelerator-Based Linear Collider

Leemans & Esarey, Physics Today (March 2009)

Scientia Potentia Est

F. Bacon

“Knowledge \propto Power”

“Power \propto Money”...

literally so for accelerators:

Tevatron (2TeV)	20 MW
LHC (7+ TeV)	120 MW
$\mu\mu$ Collider(4TeV)	140 MW
ILC(0.5TeV)	230 MW
CLIC(3TeV)	420 MW
LaserPlasma x TeV	?? GW

Desires vs Possibilities

What do HEP folks want?

$$\sigma_{\text{QED}} = \frac{90 \text{ fb}}{\text{s}} \rightarrow \mathcal{L} \propto E_{\text{cm}}^2$$

$1 \text{ TeV} \rightarrow 10^{32}$
 $10^3 \text{ TeV} \rightarrow 10^{38}$

What Accelerator geniuses can (suggest)?

X
MANY

$$\mathcal{L} = \frac{f_{\text{rep}} \cdot N_{\text{bunches}} \cdot N_p^2}{4\pi \sigma^2} = \underbrace{\left[\frac{f_{\text{rep}} \cdot N_p \cdot N_b}{4\pi p^*} \right]}_{\text{Beam power}} \cdot \underbrace{\left[\frac{N_p}{\epsilon} \right]}_{\text{BRIGHTNESS}}$$

$$\text{Power} = \eta \cdot P_{\text{WALL}}$$

$$\rightarrow P_{\text{WALL}} \leq (\text{MAX})$$

$$\rightarrow [\text{Brightness}] \sim \text{CONST}$$

$$\eta \propto E_{\text{cm}}^{-1/3} \dots -1/5$$

$$\text{Best case } \mathcal{L} = 1 \text{ MHz} \cdot \frac{(10^5 \text{ particles})^2}{(1 \text{ \AA})^2} = 10^{27} \text{ cm}^{-2} \text{ s}^{-1}$$

That Leads to New Paradigm

New Paradigm for HEP

Go After The Highest Possible Energy

Frequent and very predictable collisions but VERY low luminosity

Develop New Classes of Detectors

[Small Accelerators+Large Detectors]?

We Actually Have Started Already

Three Points of Part II:

- **Energy frontier evolution depends on scientific advances in the field of acceleration:**
 - yes, the progress has greatly slowed down
 - despite the fact that we push the technology envelopes and introduce new & improved methods regularly
- **The pace is expected to be changed by scientific breakthroughs, leading ideas include:**
 - two-beam acceleration, laser drive, plasma waves
 - new media (Meta-M) and crystals (+ even more advanced)
- **The c.m.energy increase will (most probably) NOT be accompanied by high luminosity:**
 - to make use of such accelerators, the way we extract Physics out of such events should be modified (e.g. new paradigm of low event rate detectors)

PART III:

Directions

How To Contribute

Cheerful Ending

Where Will Accelerators Evolve?

- There is a threat that the community will decide in favor of applications of the (*low complexity – low risk*) accelerators, and will gradually abandon *more complex* accelerators as a tool to push the High Energy Frontier:
 - then – no accelerator-based HEP after ~2030??
 - new acceleration methods under development now will surely be in demand for low- E applications, too (small/cheap)
- High- E physicists have to take big part in the advancement of accelerators:
 - explore and develop new methods of acceleration
 - understand how to lower the luminosity requirements

University of Chicago Role

- UChicago has unique opportunity to contribute:
 - great minds, cover broad spectrum of physics
 - two Labs – ANL and FNAL - under the UC “umbrella”
- Raising bright scientists capable of pushing the accelerator frontier seems to be natural task for UC
- Possibilities:
 - full-time/part-time faculty, adjunct professors
 - Accelerator group/chair set at the Lab (Novosibirsk model: years 3&4 – 2-3 days a week at the Lab, special courses - lectures at the Lab, lecturers from the Lab & University, research – at the Lab, full scholarship support by UC-ANL-FNAL consortium)
- To our help:
 - IARC (see next slide)

Illinois Accelerator Research Center

About IARC

- IARC is funded via grant from Illinois Department of Commerce and Economic Opportunity.
- Basic goal is to make Northern Illinois a center for accelerator development and IARC was also sold as a mechanism to support training of scientists and engineers in accelerator physics and related technology via work with local universities.
- \$ 20 M cash contribution from State of Illinois
 - Augmented by DOE OHEP contribution ~13M\$
- Start in FY10, finish construction in FY12, start operation in FY12-13
- Argonne as a key partner

“Cheerful Ending”

Not convinced yet that there is
future for the field of high
energy particle accelerators?

Let me offer
a “fully scientific” argument

Gott's Conception of *Copernican Principle*

R. Gott

Nature **363**, 315-319 (27 May 1993) | doi:10.1038/363315a0

Implications of the Copernican principle for our future prospects

J. Richard Gott, III

$\frac{1}{3}t_{\text{past}} < t_{\text{future}} < 3t_{\text{past}}$
(50% confidence level)

Let L denote the lifetime of the phenomenon in question. We observe the phenomenon in progress, so

$$L = t_{\text{past}} + t_{\text{future}}$$

High Energy Particle accelerators exist for

$$t_{\text{past}} = 90 \text{ years}$$

so with 50% confidence they will exist for another
 $t_{\text{future}} = 30 \text{ to } 270 \text{ years}$

Thank You Very Much
For Inviting Me (*Ed*) and
For Your Attention!

Hope you've got the main message
that accelerators are far from
dying but their future (say,
>2030) is dependent on scientific
breakthroughs [for us to do]
